RAW SOURCE FORMING

C:\CRF\Outhold\Vsrl628495A

C:\CRF\Outhold\Vsrl628495A

C:\CRF\Outhold\Vsrl628495A

1. The first step in the process of forming a raw source is to identify the source. This is done by the investigator who is responsible for the case. The investigator will look for any information that might lead to the source. This could be a name, a location, or a person who is known to the source. Once the source has been identified, the next step is to contact the source. This is done by the investigator who is responsible for the case. The investigator will try to establish a rapport with the source and gain the source's trust. Once the source has been contacted, the next step is to interview the source. This is done by the investigator who is responsible for the case. The investigator will ask the source questions about the case and try to get the source to provide information. Once the source has been interviewed, the next step is to analyze the information. This is done by the investigator who is responsible for the case. The investigator will look for any patterns or trends in the information and try to identify the source's role in the case. Once the information has been analyzed, the next step is to report the results. This is done by the investigator who is responsible for the case. The investigator will write a report about the source and the information that was obtained. The report will be submitted to the supervisor who is responsible for the case. The supervisor will then decide what to do with the information. If the information is useful, the supervisor will use it to help solve the case. If the information is not useful, the supervisor will discard it. The process of forming a raw source is a complex one and requires a lot of skill and experience. The investigator who is responsible for the case must be able to identify the source, contact the source, interview the source, analyze the information, and report the results. Only then can the source be used to help solve the case.
